"I sold it to my customers because they had internal corporate directives for sql compatibility in databases, they had people who knew sql already..."

...It gives people with only moderate technical skill the ability to do database queries that were not part of our filePro schema/design on their own without having to call our technical support or ask for new features"

Joe Chasan, Magnatech Business Systems

fPsql supports aggregate functions such as MIN, MAX, AVG, SUM, and COUNT:
Example: **SELECT max(price), count(*)**

The Set clause sends the query output to file, printer or screen, provides some control of print formatting, and enables querying qualified files.

"You may be surprised to learn that the greatest use of fPSQL by our customers is to build flat ascii files that they can then import into some other application such as access or excel or word"
Wayne Anschutz, Computer Resources

fPSQL is a character-based tool that provides very flexible read-only access to filePro databases using Structured Query Language (SQL). It supports the following SQL clauses:

SET, SELECT, FROM, WHERE, GROUP BY, HAVING, ORDER BY

An fPSQL Query can be as simple as:

SELECT Company, Contact, Phone FROM Custmast
